No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WPI; 2000-246496/21. P-PSDB; AAY70393. Use of lats proteins, complexes of lats and cdc2 for treating cancer that is refractory to treatment by standard chemotherapy and radiation therapy, and disorders associated with aberrant levels of cdc2 activity

Claim 44; Fig 15; 134pp; English

The present sequence is a DNA encoding Drosophila Lats (large tumour suppressor) protein which is a cell overproliferation inhibitor and a negative requiator of cell cycle-dependent kinase cdc2/cyclin A.

The present sequence is useful for treating cancer that is refractory to standard chemotherapy or radiation therapy such as hyperplasia.

C to standard chemotherapy or radiation therapy such as hyperplasia.

C to standard chemotherapy or radiation therapy such as hyperplasia.

C to standard chemotherapy or radiation therapy such as hyperplasia.

C to standard chemotherapy or radiation therapy such as hyperplasia.

C to standard degenerative disorders, growth deficiencies, hypoproliferative disorders, protein and sorders, preferably a mouse, in which a lats gene has been disrupted by homologous compounds that can be used to treat or prevent cancer, particularly skin cancer, soft tissue sarcomas and ovarian tumours, and disorders compound that the lats of the lats of the lats of the perapy.

```

```
This sequence encodes the Drosophila melanogaster large tumour suppressor lats protein, and is a composite of 2 cDNAs (an initial fragment from cDNA-9 and the rest from cDNA-A2). The sequence has been isolated from a total imaginal disc cDNA library. The corresponding genomic sequence is identical, except. for 34 minor differences, and has 7 introns. Two consensus polyadenylation sites are present. A 141-bp sequence at the 3'-end of the lats transcript is identical to the 5'-end of the untranslated sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                  · used to develop prods

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell interactions in higher ewkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequence data for this patent did not form part of the printed cification, but was obtained in electronic format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1223 CAGAATTACACACCTCTGCGATACACGCGCCCAACGGACGCAACGATGCACTTACTCCT

A monologous mouse sequence has also been isolated (m-lats, AAT42119). The gene encodes a putative proteinsorlard-kreonine-kinase, and inhibits cell proliferation and plays a crucial role throughout development. Activators or inhibitors of lats function (e.g. an antisense oligonucleotide or dominant negative lats fragment) may be used in therapy of cancer or other proliferative disorders, degenerative disorders, trauma, growth deficiency, etc., and fragments of the gene may be used as diagnostic probes. A lats-inhibitor sequence may be expressed in a transgenic plant or farm animal to confer increased growth and inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CTTCATGGAGCAACACGTGGAGAATGTCATCAAAACCTACCAGCAGAAGGTCAGCCGGAG 1559

```
The present sequence is a DNA encoding mouse Lats2 (large tumour suppressor) protein which is a cell overproliferation inhibitor and a negative regulator of cell cycle-dependent kinase cdc2/cyclin A. The present sequence is useful for treating cancer that is refractory to standard chemotherapy or radiation therapy such as hyperplasia, metaplasia, or dysplasia, and disorders associated with aberrant levels of cdc2 activity. Conditions treated by promoting cdc2 function include degenerative disorders, growth deficiencies, hypoproliferative disorders, physical trauma, lesions, and wounds. An animal model preferably a mouse, in which a lats gene has been disrupted by homologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of lats proteins, complexes of lats and cdc2 for treating cancer that is refractory to treatment by standard chemotherapy and radiation therapy, and disorders associated with aberrant levels of cdc2 activity

recombination, e.g. a lats knock-out mouse, is used for screening compounds that can be used to treat or prevent cancer, particularly skin cancer, soft tissue sarcomas and ovarian thumours, and disorders associated with pituitary dysfunction e.g. luteinizing hormone (LH) hypogonadotropic hypogonadism. The lats DNA is also used in gene therapy.
                                                                                                                                                                                                                                                                                                                    1619

```
This is the nucleotide sequence of a cDNA clone coding for a human crthologue, i.e. hWART2 (see AAY06527), of Drosophila non-receptor serine/threonine kinase WART.

Serine/threonine kinase WART.

CONSTRUCTION AND IDEATH OF THE STOCK WAS ISOLATED FOR A human bone marrow cDNA library using a PCR fragment of hWART1 as probe. hWART2 is consistently expressed in human tumour cells tines, exceptfor most of the colon cancer lines examined. This overexpression in tumour cells versus normal tissues may provide a target for oncology drug development. Nucleic acids encoding full-length hWART2 and hWART2 polypeptides lacking one or more of and anno acid segments 1-33, 43-139, 342-466, 467-480, 514-518, and 974-1048, or lacking one or more of the N-terminal domain, catalytic domain, or C-terminal domain are claimed, as well as antibodies, a method for identifying modulators of hWART function, and use of such modulator compounds to treat an abnormal condition involving hWART signal transduction, especially cancer. Probes for
                                                                                                                                                                                                                             treating cancer
                                                                                                                                                                                                   New nucleic acid encoding human orthologs of Drosophila WART proteins, used to identify specific modulators for treating (
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               involving hWART signal transduction, especially or detection of hWART nucleic acids are also claimed

The hGHITS proteins can be used in an antineoplastic pharmaceutical preparation. Probes for the hGHITS DNA sequences can be used in diagnostic pharmaceutical preparations can be used for examining expression of hGHITS genes in dwarfism, gigantism, acromegaly, angiopathy, diabetic nephropathy or cardiopathy, or in malignant tumours including breast cancer, renal adenocarcinoma, colorectal cancer, and leukaemia. Antibodies against the proteins can be used is diagnostic pharmaceutical preparation for examining expression of

'n

The present sequence encodes a human growth hormone inhibited tumour suppressor (hGHTS) protein. The hGHTS proteins can be used in an antineoplastic pharmaceutical preparation. Probes for the hGHTS bunk sequences can be used in diagnostic pharmaceutical preparations. The diagnostic pharmaceutical preparations can be used for examining expression of hGHTS genes in dwarfiam, gigantism, acromegaly, ampiopathy, diabetic nephropathy or cardiopathy, or in malignant tumours including breast cancer, renal adenocarcinoma, colorectal cancer, and lenkaemia. Antibodies against the proteins can be used in a diagnostic pharmaceutical preparation for examining expression of tumour suppressor gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a partial polypeptide which has kinase activity. The kinase polynucleotides can be used to express the polypeptides, and as probes to identify nucleic acids encoding proteins having kinase activity. The kinase polypeptides and fragmented polypeptides are used as molecular weight and isoelectric focusing markers, and as controls for peptide fragmentation. They als have a number of therapeutic uses as kinases play a central role in cellular signal transduction. The polypeptides could also be used a reagent to identify any proteins. The polypeptides can also be used a reagent to identify any proteins that the polypeptide regulates, an proteins with which it might interact. The polypeptides may also be used for preparation of antibodies. The antibodies can be used in assays to detect the presence of the protein, and to purify the protein
